Mark Janith Perera

<u>Web Component for Carousel</u>

Proposed Web Component:-

<carousel-com imageset = “image1.jpg, image2.jpg…….”> </carousel-com>

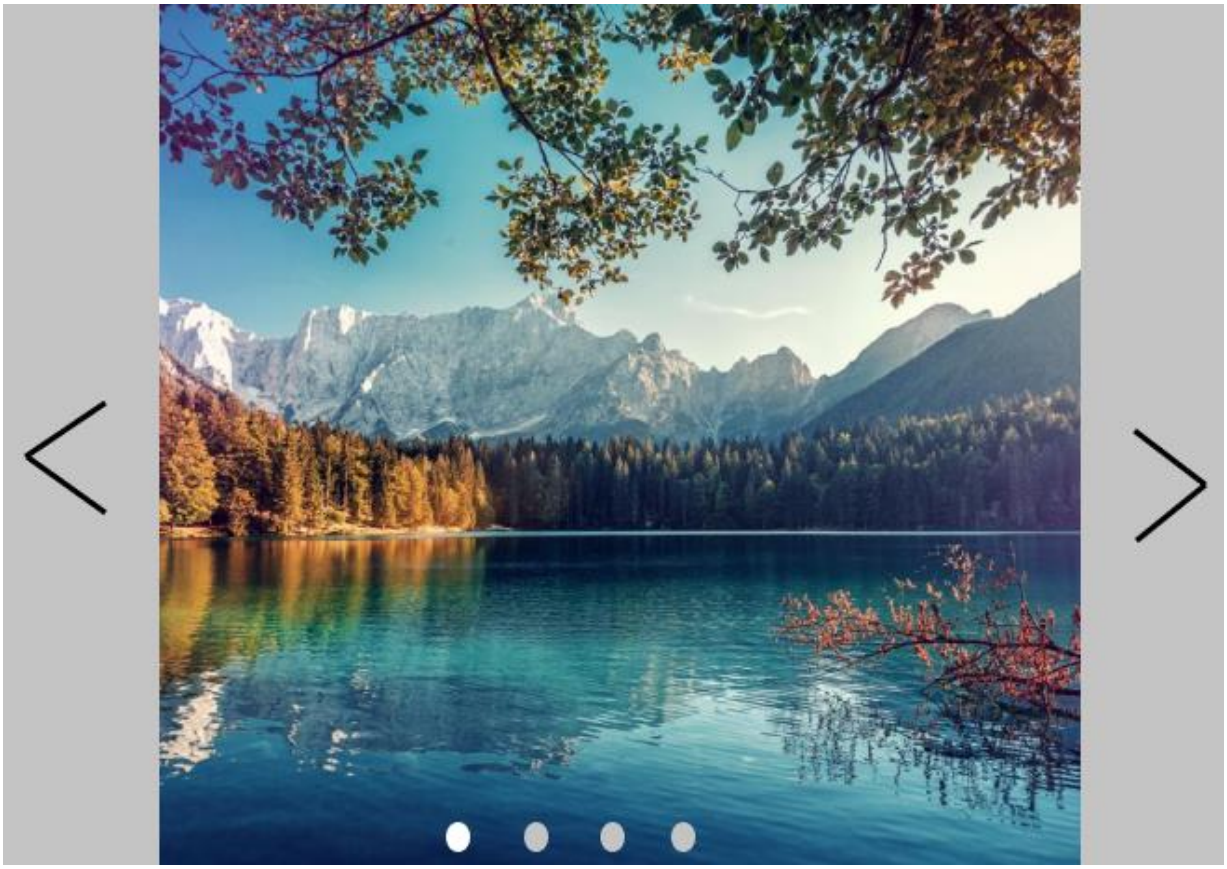

Figure 1 Expected Final view of the component.

Use:

In the present, many websites consist of carousels and it contributes highly to make the website attractive and also used for facilitating some functionalities as well (Displaying selling Items…etc).

Therefore, instead of making carousels from the scratch for each and every website or web pages, it will be convenient and also efficient to use a web-component for including carousels in websites. As a result, the complexity of the code will reduce due to the use of a single web component for carousel instead of large number of code lines.

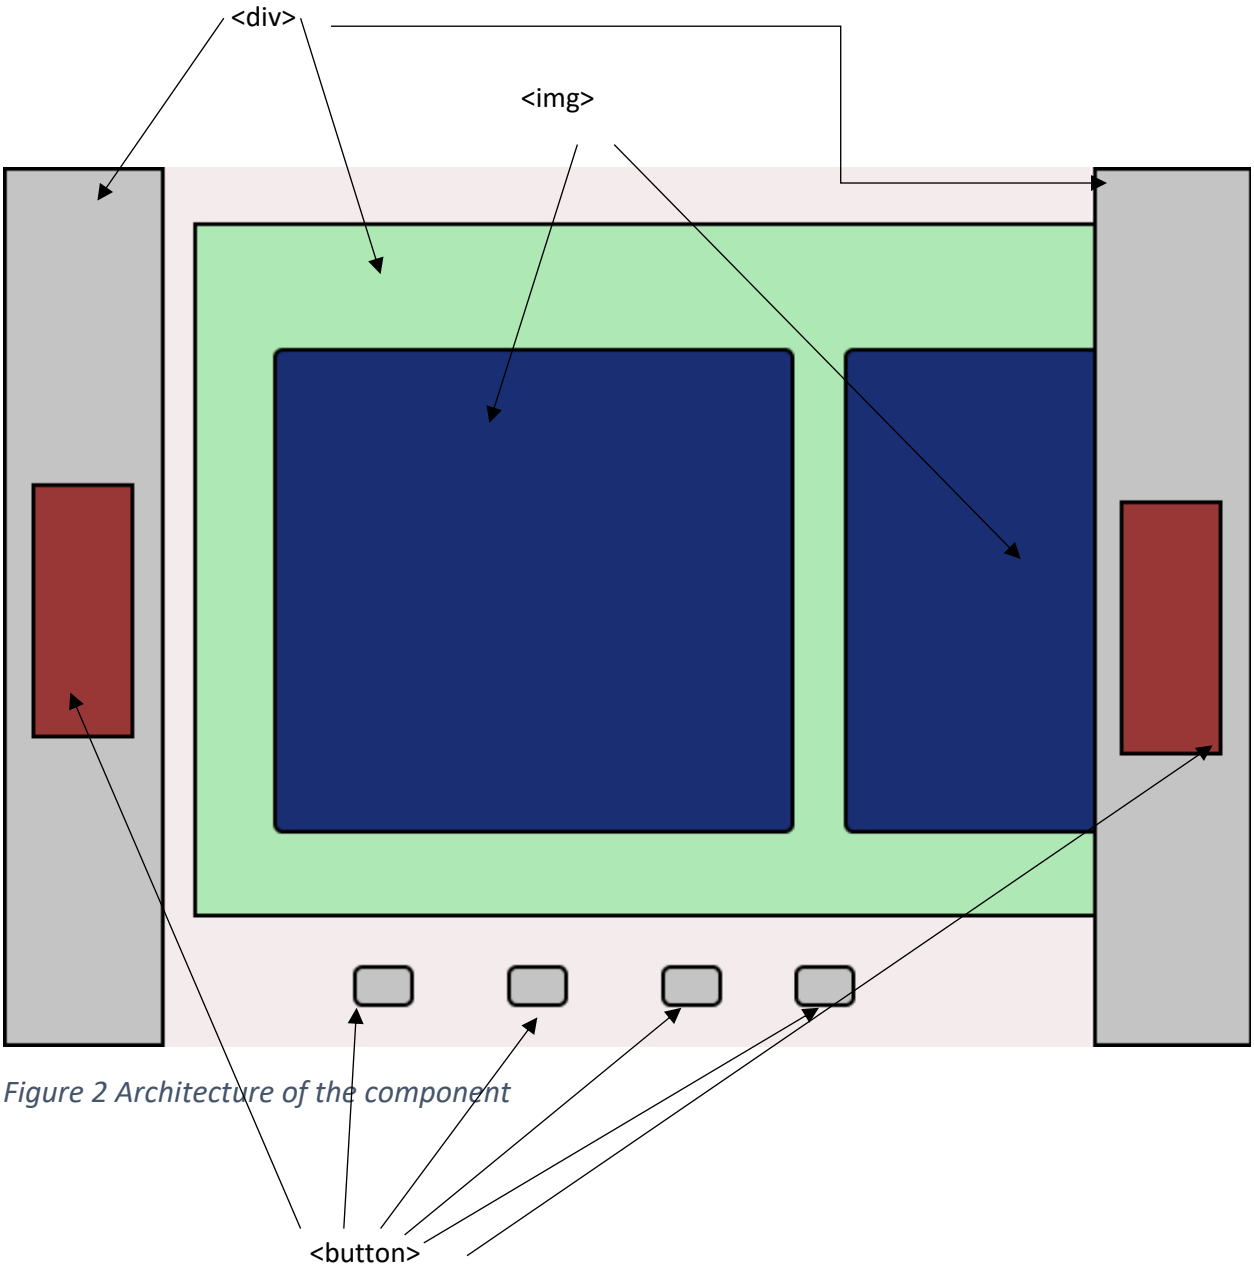

Figure 2 Architecture of the component

Main tags used-

1) - Maintain the structure.
2) <img> - To include images in slides.
3) <button> - To switch the slides.

Other Tags :- <ul> and <li>

Main Functionalities :

Carousel can be navigated by using both the arrow heads on either side of it, or else the small circular indicators(buttons) can be used to navigate through the images in the carousel.

Any number of images can be added to the carousel as an attribute of the web component.

The carousel will display a message, “Carousel: No image|” when there are no images to show.
